

Data Inventory

Not knowing the location of your sensitive data increases the potential impact and severity of a data breach, increases the exposure and risk of privacy and non-compliance violations, and can have significant impacts on the time and cost of eDiscovery matters and internal investigations.

Innovative Discovery can help you quickly and easily find sensitive data across structured and unstructured data on-premises or in the cloud. You will have visibility into what types of sensitive data you're storing, where they are located and who has access to that information.

THE DATA INVENTORY PROCESS:

- 1** Deploy data inventory software.
- 2** Define file attributes.
- 3** Configure integrations and scan data sources.
- 4** View results in dashboard.
- 5** Configure on-going scans.

HOW DOES A DATA INVENTORY INTEGRATE WITH YOUR DATA MAP?

A data inventory tells you what data you have. A data map tells you how your data is being used. Together, they give you the full story of what is going on with your data and how it is impacting your organization.
